Check your fistula every day.

If you do not know how, ask your Dialysis Care Team to teach you how to monitor your fistula.

**Look**

**Listen**

**Feel**

Did you notice anything different when you checked your fistula today?

**No change.**

**Yes, a change.**

**Great!** Keep checking each day. At your next treatment, tell your Dialysis Care Team that there was no change.

**Call the contact given to you by your Dialysis Care Team. Share what you found. They will tell you what to do next.**
When you place your fistula next to your ear, you hear the sound of the blood going through it. As the fistula grows larger, the sound becomes louder.

You feel the fistula under the skin. At first, the fistula seems small, but it should grow over time.

The surgery site is clean and dry. The skin over the fistula is all one color and looks like the skin around it.

The hand looks the same as it did before surgery.

There is redness, swelling or drainage.

The arm is bruised and/or the hand is not the normal color.

You hear no sound or decreased sound.

You cannot feel the fistula. The hand of the affected arm feels numb or cold to the touch.

During regular facility hours: 
After hours: 

Thrill: A vibration or buzz that can be felt best over the scar. This is where the artery and vein are joined together. The thrill becomes stronger over time as the fistula grows.

You feel the thrill along the rest of the fistula, but it doesn’t feel as strong as it does over the scar.

You cannot feel the thrill or it is weaker over the scar than it was the last time you checked it.

Pulse is a slight beating that feels like a heartbeat. When you place your fingers lightly on the fistula, they move slightly.

The beat is stronger than a normal pulse. Fingers placed lightly on the fistula rise and fall with each beat.
